

Pre-Sale WhitePaper

369

Version 1.0.1

The TSNCOIN pre-sale is designed to create initial participation, secure the necessary resources for infrastructure development, and form an active and committed community. This stage provides users with the opportunity to participate in the growth path of the TSNCOIN platform from the very beginning and benefit from the advantages of early involvement. The pre-sale, through fair coin distribution and strengthening the platform’s economic foundations, paves the way for the long-term success and growth of this ecosystem.

Introduction to TSNCOIN Pre-Sale

Purpose of holding the TSNCOIN pre-sale

The TSNCOIN pre-sale is designed with the purpose of creating a transparent, fair, and structured starting point for the initial entry of capital and the formation of the fundamental foundations of the ecosystem. This stage enables early users to participate in the development of the platform prior to the public offering and to play a more active role in the growth path of TSNCOIN. The primary objective of the pre-sale is not merely capital raising, but the creation of an informed, committed community aligned with the platform's long-term vision. The capital raised at this stage will be used in a targeted manner for infrastructure developments, systems launch, and platform security enhancement. The pre-sale, as the initial economic foundation, provides the necessary stability and sustainability for the subsequent stages of TSNCOIN's development.

The Role of the Pre-Sale in the Development Path of TSNCOIN

The pre-sale plays a key role in initiating the life cycle of TSNCOIN and acts as a bridge between the conceptual idea and the practical execution of the platform. This process allows the platform team to make strategic decisions based on real data and initial market feedback. Participants in the pre-sale are considered the first real users of the ecosystem, and their feedback can be effective in optimizing the development path. Overall, the pre-sale is an integral part of TSNCOIN's sustainable development strategy and establishes the platform's trajectory from the outset based on data, participation, and economic logic.

The Difference Between the Pre-Sale and the Public Sale

The TSNCOIN pre-sale differs fundamentally from the public sale in terms of objectives, structure, and target audience. This stage is specifically designed for early users and long-term participants—individuals who believe in the platform's vision and development path and whose goal is not merely short-term trading. Buyers at this stage are recognized as early supporters of the platform and, by trusting in the future of TSNCOIN and its economic model, play an important role in providing initial funding and shaping the ecosystem. In return for this early commitment, special benefits and conditions are offered to them that will not be available in the later stages of the public sale.

On the other hand, the public sale is conducted with the aim of creating broader access, increasing market participation, and generating real liquidity. This stage is typically associated with a higher supply volume, more diverse users, and more active trading behaviors, and it focuses on the official entry of the coin into the public market and ecosystem development.

In summary, the pre-sale is considered a strategic and foundational phase that shapes the economic and social foundations of TSNCOIN, while the Public Sale is responsible for market expansion, increasing liquidity depth, and public adoption of the ecosystem.

Schedule of the TSNCOIN Pre-Sale and Official Platform Launch

As outlined in the Original Whitepaper, a precise and pre-planned timeline has been established from the official commencement of the pre-sale phase to the full public launch of the TSNCOIN platform.

The pre-sale phase officially begins on June 25, 2026, at 18:00 UTC and continues for 6 months, 6 days, and 6 hours, concluding on January 1, 2027, at exactly 00:00 UTC. Immediately following the completion of this phase, the TSNCOIN platform will be officially launched and, coinciding with the beginning of the New Year, will commence operations as a symbol of the birth of a new, global, and forward-looking ecosystem.

Fundamentals

TSNCOIN is designed as the economic core of the platform and plays a key role in financial interactions, user participation, and the system's sustainable development. Every transaction, every investment, and every interaction you make on this platform is conducted through TSNCOIN, in order to provide you with an integrated, secure, and reliable digital experience.

Technical Specifications

- Coin Name: TSNCOIN
- Symbol: XTSN
- Standard: BEP-20
- Current Network: BNB Smart Chain (BSC)
- Total Supply: 369,000,000,000
- Supply Type: Fixed Supply
- Decimals: 18

The total supply is permanently fixed and cannot be increased under any circumstances. This ensures sustained scarcity and helps prevent inflation.

To prevent any potential misuse and safeguard the platform's credibility, the details of the TSNCOIN smart contract address will be disclosed simultaneously with the platform's official launch.

This process will take place on January 1, 2027, coinciding with the beginning of the New Year, and the relevant information will be made publicly available through TSNCOIN's official channels and verified social media networks.

During the pre-sale phase, only 1% of the total TSNCOIN supply has been allocated to this stage in a limited and targeted manner, equivalent to 3,690,000,000 coins. This amount has been carefully determined based on the platform's economic architecture, so that the pre-sale functions solely as an initial entry point for investors rather than a source of market saturation. This structure ensures that the pre-sale plays a rational and non-inflationary role in the TSNCOIN economy.

In the TSNCOIN pre-sale phase, in order to maintain fairness, manage risk, and create a balanced distribution among participants, limits on the purchase amount have been established. The minimum purchase amount for each user is set at 33 USDT, and the maximum purchase cap is 99,999 USDT. These limits are applied simultaneously at both the wallet and user account levels to prevent excessive concentration of purchases and imbalances in the initial coin distribution. As a result, users can participate in the pre-sale within a defined and transparent range of 33 to 99,999 USDT, without affecting the supply structure or the fairness of the ecosystem.

Pre-Sale Structure

Pricing Model

The TSNCOIN pre-sale is designed based on a staged and stepwise structure in which the price of the coins increases in a pre-determined and gradual manner. This approach is adopted with the aim of creating fair access for early users, reducing the risk of participation in the initial stages, and maintaining a sustainable balance between supply, demand, and valuation. In addition, this model, by taking into account the macroeconomic requirements of the TSNCOIN platform, seeks to ensure the necessary alignment between user interests, ecosystem sustainability, and the platform's long-term growth.

Base Pre-Sale Price

The base price of each TSNCOIN unit at the beginning of the pre-sale process is set at \$0.000369. This price level is considered the lowest entry point into the TSNCOIN ecosystem and is exclusively allocated to the first stage of the pre-sale. This price level serves as the starting point of the stepwise pricing structure and provides a special opportunity for early participants.

Staged Pre-Sale Structure

The TSNCOIN pre-sale consists of 100 independent stages. In total, 3,690,000,000 coins are allocated to this phase, and 36,900,000 coins are offered in each stage. The criterion for advancing from each stage is solely the completion of the sales capacity of that same stage, and time plays no role in stage progression. As soon as the specified quantity is fully sold, the next stage begins automatically and without interruption.

If a user's purchase volume exceeds the remaining capacity of a stage, the excess amount is automatically calculated at the price of the next stage. This mechanism prevents disruption of the stepwise pricing structure and inequality among buyers.

Stage-Based Price Increase Logic

The price of TSNCOIN increases in each stage compared to the previous stage. This price increase is designed in such a way that over the course of the 100 pre-sale stages, the coin price will gradually and in a controlled manner increase tenfold. The average price growth rate in each stage is approximately 2.3292992280%, and it is distributed uniformly across all stages in order to prevent sudden price jumps.

Sample prices across different pre-sale stages are as follows:

Price in the first stage: \$0.0003690000

Price in the second stage: \$0.0003775951

Price in the third stage: \$0.0003863904

Price in the fourth stage: \$0.0003953906

Price in the fifth stage: \$0.0004046005

Price in the tenth stage: \$0.0004539692

Price in the fiftieth stage: \$0.0011403190

Price in the one hundredth stage (final pre-sale stage): \$0.0036060053

Pre-Sale Structure

The total supply cap in the TSNCOIN pre-sale phase is set at 3,690,000,000 coins. Once this cap is reached, the pre-sale will automatically conclude, and no extension will be possible.

Post Pre-Sale Price

After the full completion of the one hundredth stage and the closure of the pre-sale, the official TSNCOIN launch price per unit will be set at \$0.0036900000, which is approximately 2.3292992280% higher than the price of the final pre-sale stage. After this stage, purchasing TSNCOIN at pre-sale special prices will no longer be possible, and the market will enter the Public Sale phase.

This pricing structure is designed with the following objectives:

- Creating a fair entry opportunity for early users
- Preventing excessive concentration of coins in the hands of whales
- Aligning the pre-sale price with the public sale price
- Creating a logical balance between early risk and early participation rewards

This pre-sale model is designed to be transparent, predictable, and fair, and to enable precise planning for all participants; so that each individual can make decisions for their transactions with full awareness.

Calculation Tool

In order to facilitate the decision-making process and financial calculations, a dedicated calculator for the TSNCOIN pre-sale will be made available on the platform's official website; this tool allows users to review different purchase scenarios, stage price changes, and related financial calculations with precision and to carry out their financial planning in a transparent and reliable manner.

USDT-Based Payment Method

In the TSNCOIN pre-sale process, all payments are made exclusively through the USDT stablecoin. The selection of USDT as the sole payment method is carried out with the aim of maintaining price stability, increasing transparency in calculations, and eliminating the risk arising from market volatility during the pre-sale period. USDT, as one of the most reputable and widely used stablecoins in the market, enables precise valuation and the reduction of calculation errors for all participants. The non-acceptance of volatile assets at this stage is considered part of the risk management approach and the enforcement of economic discipline within the TSNCOIN pre-sale structure.

Payment Network (BSC)

All transactions related to the TSNCOIN pre-sale are conducted on the BNB Smart Chain network using the BEP-20 standard. This network has been selected as the payment infrastructure during the TSNCOIN pre-sale phase. After the official launch and in the initial phase of platform operation, activities will first be carried out on BSC, and gradually the platform will be migrated to the dedicated TSNCOIN blockchain. The selection of BNB Smart Chain is based on factors such as low transaction fees, appropriate processing speed, and broad wallet compatibility, and it provides an efficient and reliable experience for participants.

Pre-Sale Structure

Payment and Purchase Registration Process

Participation in the TSNCOIN pre-sale is possible exclusively through the official platform website at www.tsncoin.com. Users can begin the purchase process after logging into their user accounts. The payment system is designed in such a way that full control over assets and final transaction confirmation always remain with the user. Within this framework, the website merely serves as an interface with the blockchain and has no access to users' assets or private keys.

Transaction Security and Confirmation Process

To ensure the security of user accounts, users complete standard protective steps during registration, including the activation of two-factor authentication (2FA). After that, the user's personal wallet (such as MetaMask or Trust Wallet) is connected to the website. At no stage does the platform have access to users' private keys, assets, or wallet control. After selecting the purchase amount, the user performs the transaction directly from their wallet with a personal signature. All transaction details, including the amount, the type of payment asset, and the pre-sale wallet address, are transparently displayed to the user before final confirmation, and no transaction will be executed without the user's signature. After the transaction is recorded on the BNB Smart Chain network and confirmed on the blockchain, the validity of the transaction is verified in terms of the network, the paid amount, and the success of the transfer. In this process, the final authority for confirming all payments is the BSC network, and the accuracy of payments is evaluated based on the immutable blockchain data, not on the website's internal processing. After final confirmation, the amount of purchased coins is recorded off-chain in the user account, and all transaction information, including the transaction hash (TxID), is transparently available in the user panel.

Protection of User Assets

In the TSNCOIN pre-sale payment structure, the following principles are fully observed:

- The platform has no access to users' private keys.
- There is no possibility of withdrawing or transferring assets without the user's direct signature.
- All payments are carried out with the explicit confirmation of the personal wallet.
- The blockchain is used as the final authority for transaction confirmation.

This structure is designed with the aim of creating maximum transparency, security, and trust, and ensures that users maintain full control over their assets throughout all stages of the pre-sale.

Benefits of Participating in the TSNCOIN Pre-Sale

Participation in the pre-sale provides a set of economic and structural benefits for early users. One of the main features of this stage is fee-free purchasing; in such a way that the entire amount paid by users is fully allocated to the purchase of TSNCOIN. From an economic perspective, participation in the pre-sale makes it possible for users, depending on the stage at which they enter the purchase process, to benefit from the price difference between the pre-sale and the launch price. The stepwise pricing structure is designed in such a way that it enables achieving returns of approximately 2.3% up to a maximum of 10 times compared to the base pre-sale price.

Pre-Sale Structure

Post-Pre-Sale Coin Lock-Up Framework

Coins allocated to participants in the TSNCOIN pre-sale are subject to a predetermined lock-up period. This mechanism is designed to prevent sudden post-launch sell pressure and ensure the economic stability of the ecosystem. This policy is part of the platform's risk management and helps protect TSNCOIN's economic structure, aligning participants' short-term interests with the network's long-term growth and preventing market instability.

The duration of coin lock-up is determined in a tiered manner, corresponding to the participant's stage in the pre-sale. Participants in the early stages of the pre-sale benefit from more favorable pricing and greater returns; therefore, their asset lock-up periods are longer. As the pre-sale stages progress and pricing advantages gradually decrease, the coin lock-up duration is progressively shortened in a tiered manner. This framework is implemented to maintain fairness among participants, align with economic objectives, and prevent short-term and unstable market behaviors.

Tiered Coin Locking Schedule

The lock-up duration for coins at different stages of the pre-sale is determined as follows:

- Stage 1: 100 days lock
- Stage 2: 99 days lock
- Stage 3: 98 days lock
- ...
- Stage 99: 2 days lock
- Stage 100: 1 day lock

If a user participates in multiple pre-sale stages, coins purchased in each stage will have separate lock-up periods corresponding to that stage. As a result, coins will be released gradually according to each stage's schedule, with each portion becoming available once its respective lock-up period ends.

Tiered Lock-up Equation: $101 - n = x$

n The stage number is denoted as (from 1 to 100).

x The number of days your coins will be locked.

Example for the thirty-third stage: $101 - 33 = 68$

Example for the sixty-sixth stage: $101 - 66 = 35$

Example for the ninety-ninth stage: $101 - 99 = 2$

Use and Nature of Purchased Coins

The coins purchased during the pre-sale phase are, in terms of nature, functionality, and level of access, fully equivalent to the coins that will be available after the official launch of the platform. The timing of coin purchase does not affect its features or uses within the platform. The coins are fully defined within the technical infrastructure of the platform, and the ability to use them across all sections and operational modules of the ecosystem, including the SAM System, XTSN Games, and other parts of the TSNCOIN platform, is provided. There are no hidden privileges, unfair advantages, or structural differences among the coins. All uses, rights, and conditions of coin utilization are defined transparently and are applied equally to all users and investors. This approach is adopted with the aim of maintaining transparency, fairness, and trust across the entire platform.

Pre-Sale Structure

Status of Coins After Official Launch

With the official launch of the TSNCOIN platform, the process of transferring unlocked coins will be carried out on-chain. The release of the coins will take place in a single batch and on the specified date. After the lock-up period of each stage ends, the coins will be transferred directly to the user's wallet without the application of any additional restrictions. This process is designed in such a way that transfers are carried out transparently, automatically, and according to the schedule. After the coins are transferred to users' wallets, there will be no technical or operational limitations on withdrawing, holding, or transferring the assets, and users will have full ownership of their coins and will be able to manage their assets without technical restrictions, in accordance with platform rules and market conditions. In the initial phase after launch, TSNCOIN will be listed on reputable decentralized exchanges (DEX), and from that time, the ability to trade the coins in secondary markets will be available to users. The coins lock-up and release structure is designed in such a way that, while preserving the interests of pre-sale participants, it supports market stability in the early stages of launch and provides the foundation for the sustainable growth of the TSNCOIN ecosystem.

Refund Policy (Money-Back Guarantee)

TSNCOIN has been developed with a clear vision for the future and a sustainable, transparent economic structure. The platform follows a carefully planned and systematically executed growth path, and at the same time, to increase user trust and confidence during the pre-sale, a refund option is provided for all user accounts. In this process, a maximum fee of 3% will be deducted to cover processing and transaction costs, and the remaining amount will be returned to the user's wallet. Upon submitting a refund request, all benefits, rewards, and any interests related to participation in the pre-sale for that user will be canceled. In order to prevent the occurrence of any disruption in the reward system mechanism and the platform's ongoing programs, the review and refund process after a user's request may take up to one month. This policy reflects our full confidence in the platform's future and demonstrates our transparency with investors.

Note: The TSNCOIN platform has been built from day one on the principles of transparency, commitment fulfillment, and long-term planning. In line with this approach, the pre-sale has been designed not as a requirement for the continued development of the project, but as an opportunity for the community to participate early in the growth of the ecosystem. Accordingly, the amount sold during the pre-sale period will have no impact on the team's commitment to executing the roadmap and achieving the stated objectives. The development team is committed to pursuing all project plans, timelines, and public commitments in accordance with the officially announced schedule and without unnecessary delays or changes. The pre-sale may facilitate the development and expansion of the ecosystem, but it has never been considered a fundamental pillar of the project's advancement. The development path of TSNCOIN has been planned independently of the pre-sale results and will be pursued with the same level of dedication. Furthermore, any coins allocated to the pre-sale that remain unsold by the end of this phase will be transferred in full, without any exception, to the SAM System fund. This action is intended to strengthen the long-term sustainability of the ecosystem's economy, increase the operational capacity of the SAM System, and support the continuous growth of the TSNCOIN platform.

Reward System

Reward System Mechanism

In addition to pricing advantages, the TSNCOIN platform has designed a multi-layered reward system for active users. This system is designed to increase engagement, encourage continuous participation, and create sustainable motivation. It includes three main frameworks: individual participation, team participation, and lottery-based models. Each of these frameworks follows a cyclical reward distribution structure, and rewards are paid on a weekly and monthly basis. The details regarding the method of execution will be transparently presented in the subsequent sections of the whitepaper.

One of the key principles in designing the reward system is that the rewards paid to users are calculated based on the pre-sale stage. In other words, at whatever pre-sale stage we are in, receiving rewards will be equivalent to the user's reinvestment in that same stage. This approach causes the value of the rewards to be calculated according to the pricing conditions of each stage so that, through gradual accumulation, it creates a compounding effect. Ultimately, the total value of users' assets will increase significantly.

Reward Unlocking Mechanism

All rewards that are paid during the pre-sale phase are added to participants' accounts only with TSNCOIN and in an off-chain manner. These rewards will be non-withdrawable until the official launch of the platform and the end of the lock-up periods. After the launch and the end of the asset lock-up process, the rewards will be transferred to users' wallets and will become available to them.

For example, if a participant receives a reward of \$90 in the first pre-sale stage, this reward is credited to their user account in TSNCOIN at the price rate of that stage. After the official platform launch and the end of the lock-up period, based on the TSNCOIN price at the time of launch, the reward's value increases to \$900, and the user can fully withdraw and use it.

The benefits of the pre-sale are defined with the aim of creating economic incentives for early participation, while simultaneously preventing the emergence of short-term and unstable behaviors and encouraging users toward active and long-term participation in the ecosystem.

The use of a tiered pricing model, the elimination of purchase fees, and the reward distribution mechanism provide a transparent and coherent framework that is aligned with the economic principles of the pre-sale and helps the sustainability of the ecosystem.

Note 1: All rewards granted to users during the pre-sale period are directly funded from the coins allocated to the pre-sale. In other words, these rewards are not paid from external sources or a separate treasury but are part of the same coins defined within the TSNCOIN pre-sale framework. Paying rewards from the pre-sale coin fund aligns the interests of the platform and the users, as all incentives are provided within a predefined and transparent economic structure.

Note 2: Rewards are allocated exclusively to direct TSNCOIN purchases in the pre-sale, and coins that are received as rewards will not again be eligible for additional rewards.

Reward System

Note 3: The system consists of independent weekly and monthly cycles, each of which is executed on a regular basis. At the end of each cycle, users' performance is evaluated based on predefined criteria, and rewards are calculated and distributed. In the weekly cycles, users' activities throughout the week are reviewed, and if the required conditions are met, a reward will be allocated to them. After the weekly cycle is reset, users can participate again in the evaluation and reward-receiving process with the start of a new cycle. The same mechanism is applied in the monthly cycles, and rewards are calculated and distributed at the end of each month. Users can participate again in each cycle without dependence on their past performance, as the platform focuses on their continuous participation and activity. This approach prevents the accumulation of advantages in the hands of a limited group and ensures fair competition and sustainable participation on the TSNCOIN platform.

Note 4: Eligibility for receiving individual, team, and lottery-based rewards is contingent upon having an active user account. A user account is considered an "active account" when the user has first personally participated in the TSNCOIN pre-sale and has then referred at least three other users to the platform through their dedicated referral code, and all three referred users have also completed the purchase process. After these conditions are met, the relevant user account will remain in active status until the end of the pre-sale stage, and participation in all reward distribution mechanisms will be enabled for it.

Weekly Individual Reward

In this model, users' performance is evaluated based on the total volume of purchases made by each account during a weekly cycle, rather than on the number of transactions or the amount of each individual purchase. Therefore, the total purchases made over the course of a week are considered as the criterion for user ranking, and users can improve their position in the ranking by making multiple purchases.

In the rewards panel, the list of the top 10 users each week is displayed based on the highest purchase volume. From this list, only the top three users will be eligible to receive individual rewards. The reward amount is calculated as a percentage of the total purchase amount of that same week; such that the first-ranked user receives 9%, the second-ranked user receives 6%, and the third-ranked user receives 3% of their weekly purchase amount as a reward.

At the end of each weekly cycle, the ranking and reward calculation process is finalized, and the corresponding rewards are credited to the top users. Simultaneously, with the start of the new week, all values and rankings are reset, and the competition begins anew without dependence on the results of the previous week, giving all active users an equal opportunity to appear again on the top list. This mechanism creates a fair competitive environment throughout the pre-sale period.

Reward System

Monthly Individual Reward

This model is designed based on the direct referral of new users and the level of their participation in the TSNCOIN purchase process. In this model, merely referring users is not sufficient; the referred individuals must complete their purchase process in order to be included in the reward calculations. This system is executed in different stages and in the form of monthly cycles, and at the end of each month, all values are reset and a new cycle begins.

The reward for each stage is paid solely if the number of referred individuals reaches the specified threshold for that stage, and the referred individuals have completed their purchase process. If this condition is not met, no reward will be granted to the user for that stage. For example, if during a monthly cycle only two individuals are referred instead of three, the corresponding reward for that stage will not be activated.

This model includes three specific stages.

- In the first stage, the user must directly invite at least three people to the platform using their referral code. After meeting the necessary conditions, the user will receive a monthly reward equal to 3% of the total purchases of these three people.
- After completing the first stage, the user enters the second stage. In this stage, the user must invite 6 new people to the platform. After meeting the necessary conditions, the second-stage reward is activated and an amount equal to 6% of the total purchases of these 6 people is paid to the user.
- To receive the third-stage reward, the user must invite 9 new people to the platform. After meeting the necessary conditions, an amount equal to 9% of the total purchases of these 9 people will be granted to the user as a reward.

Accordingly, each user can invite a maximum of 18 individuals to the platform per month.

As previously mentioned, at the end of each month, all steps, amounts, and statuses are reset. Users can start the referral process from the beginning in the new monthly cycle and try again to earn new rewards.

Numerical example:

Assume that each referred user makes a purchase of \$3,690.

First stage (3 people): Total purchases of the referred individuals, $3 \times 3,690 = 11,070$

- The first-stage reward is equal to 3% of \$11,070, which is \$332.10.

Second stage (6 people): Total purchases of the referred individuals, $6 \times 3,690 = 22,140$

- The second-stage reward is equal to 6% of \$22,140, which is \$1,328.40.

Third stage (9 people): Total purchases of the referred individuals, $9 \times 3,690 = 33,210$

- The third-stage reward is equal to 9% of \$33,210, which is \$2,988.90.

Reward System

Team Reward Mechanism

To strengthen collective participation, grow the community, and motivate group activity on the TSNCOIN platform, the infrastructure for forming teams and joining teams has been provided for all users. This feature allows users to operate as a team and, in addition to individual rewards, increase their chances of receiving team-based rewards.

To prevent abuse, the formation of fake teams, and irregular use of this structure, creating any team requires a fixed fee of \$9. This mechanism ensures that teams are formed with the purpose of genuine activity and effective participation.

The user who creates the team is recognized as the team leader. The team leader holds a key managerial role within the team structure, and the team's activities are defined under their identity. In addition, the leader can set internal rules for their team to ensure better management, including determining whether the team is open or closed, the minimum purchase required to join the team, and other rules that help shape the team's identity and operational framework.

Team Ranking Criteria

Teams are ranked based on the total purchase volume of their members. The team that records the highest purchase volume in a cycle is recognized as the top team. In this evaluation, only the team's purchase volume is considered, and no other factor is taken into account in the ranking.

Member Ranking Within the Team

Within each team, members are ranked based on their individual purchase volume. The user with the highest purchase volume holds the first rank in the team, and the other members are arranged from highest to lowest based on their purchases. This internal ranking clarifies members' performance and strengthens motivation for healthy intra-team competition.

Management Reward

In order to create incentives for effective management of teams and to strengthen healthy competition at the team level, the TSNCOIN platform has introduced a weekly managerial reward for leaders of the top teams. At the end of each weekly cycle, teams are ranked based on total purchase volume, and the leaders of the top three teams are granted rewards as follows:

- The leader of the team that achieves first place will receive a reward of \$99.
- The leader of the team that achieves second place will receive a reward of \$66.
- The leader of the team that achieves third place will receive a reward of \$33.

These rewards are calculated on a weekly basis and are granted to eligible leaders after the ranking for each cycle is finalized.

Reward System

Weekly Team Reward

In this model, members of the top teams are rewarded based on their team performance. At the end of each weekly cycle, teams are ranked according to the total purchase volume of their members, and the top three teams become eligible to receive team rewards.

Rewards in each team are distributed based on the ranking of the members of that team.

- In the team that achieves first place, the top 9 members of the team will each receive a reward of \$90.
- In the team that achieves second place, the top 6 members of the team will each receive a reward of \$60.
- In the team that achieves third place, the top 3 members of the team will each receive a reward of \$30.

As mentioned earlier, the top members of each team are selected based on their weekly purchase volume, and at the end of the week, the rankings are reset so that in the new cycle, teams and members compete again.

Monthly Team Reward

This Reward is designed to strengthen long-term collaboration and encourage sustainable activity within the TSNCOIN platform community. This model focuses on the overall performance of teams during each monthly cycle, and rewards are directly divided among the members of the top teams. At the end of each monthly cycle, the top three teams are determined based on total purchase volume, and then their total purchase volumes are combined and used as the basis for calculating the monthly reward.

Each team's share of this reward is determined based on the team's rank, so that the first team receives 9%, the second team 6%, and the third team 3% of the total reward.

Numerical Example:

Assume that at the end of a month, the performance of the top three teams is as follows:

- First team: \$90,000 purchase volume
- Second team: \$60,000 purchase volume
- Third team: \$30,000 purchase volume

Total purchase volume of the three teams: $\$30,000 + \$60,000 + \$90,000 = \$180,000$

- The first team's share, 9% of \$180,000, is \$16,200.
- The second team's share, 6% of \$180,000, is \$10,800.
- The third team's share, 3% of \$180,000, is \$5,400.

Each team's reward is first calculated based on the team's rank and then equally divided among the team members. If the user account is active, each member's share is deposited into their account. This mechanism ensures that rewards are granted only to active members and encourages genuine team participation.

Reward System

Weekly Lottery-Based Rewards

At the end of each weekly cycle, 33 users are randomly selected from all active user accounts. For each of these 33 selected users, the Spin the Wheel mechanism is activated, and they can try their luck for the weekly reward by spinning the wheel. The amount of each user's reward is determined based on the result of the wheel. This model strengthens active user participation by creating short-term incentives.

Monthly Lottery-Based Rewards

This model is designed to create equal opportunities for all active users and to strengthen continuous participation on the TSNCOIN platform. At the end of each monthly cycle, a lottery process is conducted among all active user accounts, and the winners are selected randomly.

In each monthly cycle, 9 users are selected as winners, and the prizes are distributed as follows:

- The first 3, whose names are announced in the lottery, will each receive \$99.
- The next 3 will each receive \$66.
- The final 3 will each receive \$33.

This model is designed as a complement to the platform's other reward mechanisms, and alongside individual and team models, it provides an opportunity for users to both improve their performance and benefit from luck-based rewards.

Final Notes and Remarks

Risk Disclosure and Legal Disclaimer

The purchase price during the pre-sale stage is significantly lower than the launch price, giving participants the opportunity to benefit from more favorable prices. If the platform's goals are achieved, this difference could lead to an increase in the coin's value. However, participation in the TSNCOIN pre-sale still involves market volatility and risks, and the coin's value after the launch may be affected by factors such as overall market conditions, adoption rate, supply and demand, and economic variables.

TSNCOIN operates according to a phased roadmap. The full achievement of the platform's technical and commercial goals depends on the successful execution of development stages, market conditions, and external factors. Although the platform team is committed to implementing the announced plans, the timing and final outcomes may be affected by unpredictable variables.

All users are advised to carefully review the platform's conditions, economic structure, reward mechanisms, and market risks before making any financial decisions, and to consult independent financial advisors if necessary. Participation in the pre-sale constitutes informed acceptance of these risks.

This platform does not provide any financial, investment, or legal advice to users. All decisions must be made based on personal assessment, independent analysis, and full understanding of the risks. Users are responsible for all their financial actions. Additionally, users are required to comply with all financial and legal regulations applicable in their place of residence, and the responsibility for adhering to these laws rests with the users themselves.

Post-Pre-Sale Roadmap

After the official launch of the platform, as soon as commercial activities begin, the TSNCOIN smart contract address will be publicly released. From that moment on, public buying and selling of the coin will be active, and users will be able to easily conduct their transactions. Additionally, the SAM System (staking and mining system) will also be available to all users simultaneously from the very start of the launch. This system allows users to actively participate in the process of securing and validating the network and to benefit from its advantages. To maintain market balance and stability, the tiered selling limit mechanism (anti-whale system) will be activated immediately after trading begins. In addition, at the time of launch, TSNCOIN will be listed on a reputable DEX (decentralized exchange) and enter the open market, enabling users to conduct their transactions easily and with a high level of security.

After the official launch, the main focus will be on stabilizing the platform's technical performance, optimizing its infrastructure, and ensuring the ecosystem's sustainability. These actions are aimed at building a secure and reliable foundation, supporting market growth, and attracting more users.

This process will be carried out in multiple phases, focusing on practical and sustainable implementation rather than promotional hype or unrealistic claims. Our ultimate goal is to establish TSNCOIN as a fully operational digital currency, widely adopted across various industries and economic ecosystems, with its value proven through real-world applications.
